GUI Homework 1 Summary

These resources explain that full-stack development means building both the user-facing front end and the back-end systems that handle logic, data, APIs, and deployment.

For this class in particular, the most relevant skills are HTML, CSS, JavaScript, DOM manipulation, responsive design, and understanding how users interact with visual interfaces.

The roadmap and article also emphasize that developers should understand databases, HTTP/REST, Git, debugging, and application architecture so the interface can connect properly to real data and services.
